June 18, 2026

Dear Hiring Manager,

I am applying for the AI Automation Specialist role. My background is in full-stack engineering, AI-assisted workflow development, backend systems, dashboards, and business process automation. Over the past 5+ years, I have built production systems for logistics, mobility, education, oil and gas operations, AI tools, and customer-facing automation. The part of this role that stands out to me is the mix of business process discovery, AI enablement, reporting automation, and connected systems. That is exactly the kind of work I enjoy: finding repetitive manual workflows, understanding why they exist, and turning them into reliable systems that save time and improve visibility.

Several of my projects map directly to the problems your client wants to solve. I built Remote Job Automator, a 7-phase AI automation pipeline that scans remote job openings, finds contacts, and generates personalized AI-assisted outreach using Python and Google Gemini. I also built ChatBot Pro, an AI-powered chatbot SaaS platform for lead capture, customer inquiries, and appointment booking. In logistics and mobility, I led work on VendRush and Oya Riyders, platforms involving dispatch workflows, real-time tracking, payments, Google Maps, and operational coordination. These projects required me to connect systems, reduce manual work, design repeatable workflows, and make operational data easier to act on.

I also bring strong reporting and dashboard experience. My Intelligent Flood Warning System used Python, XGBoost, LSTM, FastAPI, and Next.js to provide real-time risk visibility through an interactive dashboard. For the Bauchi State Ministry of Education BECE result portal, I worked on backend performance for a high-traffic reporting system serving over 50,000 students, using Redis caching, query optimization, and database indexing to improve reliability during peak usage. These experiences give me a practical understanding of how important accurate, timely, automated reporting is for leadership and operations teams.

While much of my portfolio uses tools like Python, FastAPI, Django, OpenAI, Gemini, Supabase, PostgreSQL, Redis, APIs, and serverless functions, the same principles transfer directly into Claude Desktop Enterprise, Claude Projects, MCP integrations, Zapier, Make.com, n8n, Microsoft 365, Smartsheet, CRM systems, and other connected business platforms. I am comfortable learning the specific toolchain of an organization, but my deeper strength is knowing how to map a workflow, identify bottlenecks, design the right automation path, and implement a solution that non-technical teams can actually adopt.

I would bring a practical, ownership-driven approach to this role. I can meet with department leaders, gather requirements, document workflows, build AI-assisted templates and automations, connect systems through APIs or automation platforms, and support employees as they adopt new tools. I am especially interested in helping teams reduce spreadsheet-heavy reporting, automate recurring tasks, and turn Claude-powered workflows into everyday productivity systems.

I am based in Africa and available for fully remote work aligned with U.S. business hours. I would welcome the opportunity to show how my background in AI automation, full-stack systems, workflow design, and operational problem-solving can help your client scale AI adoption across departments.

Sincerely,

Akanang David Ignatius
